Trademarks

Product names or trademarks appearing in this manual are for identification purpose only and are the properties of the respective owners.

Caution

To avoid damage to the system:
• Use the correct AC input voltage range.

To reduce the risk of electric shock:
• Unplug the power cord before removing the system chassis cover for installation or servicing. After installation or servicing, cover the system chassis before plugging the power cord.

Battery:
• Danger of explosion if battery incorrectly replaced.
• Replace only with the same or equivalent type recommend by the manufacturer.
• Dispose of used batteries according to the battery manufacturer’s instructions.
FCC and DOC Statement on Class B

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

• Reorient or relocate the receiving antenna.
• Increase the separation between the equipment and the receiver.
• Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
• Consult the dealer or an experienced radio TV technician for help.

Notice:

1. The changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

2. Shielded interface cables must be used in order to comply with the emission limits.
Notice

An electronic file of this manual is included in the CD. To view the user's manual in the CD, insert the CD into a CD-ROM drive. The autorun screen (Main Board Utility CD) will appear. Click “User's Manual” on the main menu.

Chapter 1 - Introduction

Features

Processor
• Intel® Pentium® M Dothan processor
  - 533MHz/400MHz system data bus
• Intel® Celeron® M processor
  - 400MHz system data bus
• Processor socket: mPGA479M

Chipset
• Intel® 915GM chipset
  - Intel® 915GM Graphics Memory Controller Hub (GMCH)
  - Intel® 82801FBM I/O Controller Hub (ICH6)

System Memory
• Two 184-pin DDR SDRAM DIMM sockets
• Supports single channel (64-bit wide) memory interface
• Unbuffered PC3200 (DDR400) or PC2700 (DDR333) DDR SDRAM DIMM
• Supports maximum of 2GB system memory using 256Mbit, 512Mbit or 1Gbit technology for x8 and x16 devices, non-ECC memory

BIOS
• Award BIOS
• 4Mbit flash memory

Energy Efficient Design
• Supports ACPI specification and OS Directed Power Management
• Supports ACPI STR (Suspend to RAM) function
• Wake-On-Events include:
  - Wake-On-PS/2 Keyboard/Mouse
  - Wake-On-USB Keyboard/Mouse
  - Wake-On-LAN
  - Wake-On-Ring
  - RTC timer to power-on the system
• System power management supported
Introduction

- CPU stopped clock control
- Microsoft®/Intel® APM 1.2 compliant
- Soft Power supported - ACPI v1.0a specification
- AC power failure recovery

Damage Free Intelligence
- Monitors CPU/system temperature and overheat alarm
- Monitors CPU(V), +1.5V, +3.3V, +5V, +12V, -12V, VBAT(V) and 5VSB(V) voltages and failure alarm
- Monitors CPU/chassis/2nd fan speed and failure alarm
- Read back capability that displays temperature, voltage and fan speed
- Watchdog timer function

Onboard Graphics Features
- Integrated display interface
  - Analog CRT DAC interface support
    - Supports max DAC frequency up to 400MHz
    - 24-bit RAMDAC support
    - Up to 2048x1536 mode support
  - Digital LVDS interface support
    - Integrated dual channel LVDS interface support
    - Supports 25 to 112MHz single/dual channel LVDS interface
    - Single channel LVDS interface support: 1 x 18 bpp
    - Dual channel LVDS interface support: 2 x 18 bpp
- Internal graphics features
  - DVMT 3.0 support
    - 1MB or 8MB of pre-allocated memory supported
  - Intel® Dual-Frequency Graphics Technology
  - Intel® Smart 2D Display Technology
  - Dual Independent display pipes
  - 32-bit hardware cursor supported
  - 2D graphics engine
    - Optimized 256-bit BLT engine
    - 32-bit Alpha blended cursor
- High quality 3D setup and render engine
  - Triangle lists, strips and fans
  - Supports D3D and OGL pixelization rules
  - Shadow maps
  - Zone rendering 2.0 support
- High quality texture engine
  - 533 MegaTexel/sec performance - 266 Mpixel/sec fill rate up to 2 bilinear textures
  - Per-pixel perspective corrected texture mapping
- 3D graphics rendering enhancements
  - 16- and 24-bit Z buffering
  - Maximum 3D resolution supported: 1600x1200x32

PCI Express Based Graphics Interface
- PCI Express architecture support for external graphics devices
- One 16-lane PCI Express port (x16 PCI Express port) intended for Graphics Attach
- Fully compliant to the PCI Express Base Specification revision 1.0a
- Base PCI Express frequency support of 2.5Gb/s only
- PCI Express power management support

Onboard Audio Features
- Realtek ALC655
- 18-bit stereo full-duplex codec with independent variable sampling rate
- High quality differential CD input
- True stereo line level outputs
- S/PDIF-in/out interface
- 5.1-channel audio output

Onboard LAN Features
- RTL8110SB Gigabit ethernet controller
- Supports 10Mbps, 100Mbps and 1Gbps data transmission
- IEEE 802.3 (10/100Mbps) and IEEE 802.3ab (1Gbps) compliant

Serial ATA Interface
- Supports two SATA (Serial ATA) interfaces which are compliant with SATA 1.0 specification (1.5Gbps interface)
**Introduction**

**IDE Interface**
- Supports up to UltraDMA 100Mbps hard drives
- PIO Mode 4 Enhanced IDE (data transfer rate up to 14MB/sec.)

**IEEE 1394 Interface**
- VIA VT6307
- Supports two 100/200/400 Mb/sec ports

**Rear Panel I/O Ports**
- 1 mini-DIN-6 PS/2 mouse port
- 1 mini-DIN-6 PS/2 keyboard port
- 1 DB-25 parallel port
- 1 DB-9 serial port
- 1 DB-15 VGA port
- 1 IEEE 1394 port
- 1 RJ45 LAN port
- 4 USB 2.0/1.1 ports
- Mic-in, line-in and line-out

**I/O Connectors**
- 2 connectors for 4 additional external USB 2.0/1.1 ports
- 3 connectors for 3 external serial ports
- 1 connector for 1 external IEEE 1394 port
- 1 LCD brightness control connector
- 1 LVDS LCD panel connector
- 1 LCD/Inverter power connector
- 1 LCD AUX power connector
- 1 front audio connector for line-out and mic-in jacks
- 1 CD-in internal audio connector
- 1 S/PDIF-in/out connector
- 1 connector for IrDA interface
- 2 Serial ATA connectors
- 1 40-pin IDE connector
- 1 floppy connector
- 1 20-pin ATX power connector
- 1 front panel connector
- 1 chassis open connector
- 3 fan connectors
Introduction

Expansion Slots
• 1 PCI Express x16 slot
• 1 PCI Express x1 slot
• 2 PCI slots

Compatibility
• PCI 2.2 and AC ’97 compliant

PCB
• 6 layers, microATX form factor
• 24.4cm (9.6”) x 24.4cm (9.6”)

Special Features of the System Board

Watchdog Timer

The Watchdog Timer function allows your application to regularly “clear” the system at the set time interval. If the system hangs or fails to function, it will reset at the set time interval so that your system will continue to operate.

PCI Express

PCI Express is a high bandwidth I/O infrastructure that possesses the ability to scale speeds by forming multiple lanes. The system board currently supports the physical layer of x1 and x16 lane widths.

The x1 PCI Express lane supports transfer rate of 2.5 Gigabytes (250MBbps) per second. The PCI Express architecture also provides a high performance graphics infrastructure by enhancing the capability of a x16 PCI Express lane to provide 4 Gigabytes per second transfer rate.

DDR

Double Data Rate SDRAM (DDR SDRAM) is a type of SDRAM that doubles the data rate through reading and writing at both the rising and falling edge of each clock. This effectively doubles the speed of operation therefore doubling the speed of data transfer.
5.1-channel audio output

The audio jacks at the rear panel will support 6-channel audio only when the audio utility is configured to support this function. The mic-in at the rear will be disabled. Use the front audio's mic-in jack.

S/PDIF

S/PDIF is a standard audio file transfer format that transfers digital audio signals to a device without having to be converted first to an analog format. This prevents the quality of the audio signal from degrading whenever it is converted to analog. S/PDIF is usually found on digital audio equipment such as a DAT machine or audio processing device. The S/PDIF connector on the system board sends surround sound and 3D audio signal outputs to amplifiers and speakers and to digital recording devices like CD recorders.

Serial ATA Interface

Serial ATA is a storage interface that is compliant with SATA 1.0 specification. With speed of up to 1.5Gbps, it improves hard drive performance faster than the standard parallel ATA whose data transfer rate is 100MB/s.

IEEE 1394 Interface

IEEE 1394 is fully compliant with the 1394 OHCI (Open Host Controller Interface) 1.1 specification. It supports up to 63 devices that can run simultaneously on a system. 1394 is a fast external bus standard that supports data transfer rates of up to 400Mbps. In addition to its high speed, it also supports isochronous data transfer which is ideal for video devices that need to transfer high levels of data in real-time. 1394 supports both Plug-and-Play and hot plugging.

IrDA Interface

The system board is equipped with an IrDA connector for wireless connectivity between your computer and peripheral devices. The IRDA (Infrared Data Association) specification supports data transfers of 115K baud at a distance of 1 meter.
USB Ports

The system board supports USB 2.0 and USB 1.1 ports. USB 1.1 supports 12Mb/second bandwidth while USB 2.0 supports 480Mb/second bandwidth providing a marked improvement in device transfer speeds between your computer and a wide range of simultaneously accessible external Plug and Play peripherals.

Dual Function Power Button

Depending on the setting in the “Soft-Off By PWR-BTTN” field of the Power Management Setup, this switch will allow the system to enter the Soft-Off or Suspend mode.

Wake-On-Ring

This feature allows the system that is in the Suspend mode or Soft Power Off mode to wake-up/power-on to respond to calls coming from an external modem or respond to calls from a modem PCI card that uses the PCI PME (Power Management Event) signal to remotely wake up the PC.

**Important:**
If you are using a modem add-in card, the 5VSB power source of your power supply must support a minimum of ≥720mA.

Wake-On-LAN

This feature allows the network to remotely wake up a Soft Power Down (Soft-Off) PC. It is supported via the onboard LAN port or via a PCI LAN card that uses the PCI PME (Power Management Event) signal. However, if your system is in the Suspend mode, you can power-on the system only through an IRQ or DMA interrupt.

**Important:**
The 5VSB power source of your power supply must support ≥720mA.
Wake-On-PS/2 Keyboard/Mouse

This function allows you to use the PS/2 keyboard or PS/2 mouse to power-on the system.

**Important:**

The 5VSB power source of your power supply must support ≥720mA.

Wake-On-USB Keyboard/Mouse

This function allows you to use a USB keyboard or USB mouse to wake up a system from the S3 (STR - Suspend To RAM) state.

**Important:**

If you are using the Wake-On-USB Keyboard/Mouse function for 2 USB ports, the 5VSB power source of your power supply must support ≥1.5A. For 3 or more USB ports, the 5VSB power source of your power supply must support ≥2A.

RTC Timer to Power-on the System

The RTC installed on the system board allows your system to automatically power-on on the set date and time.

ACPI STR

The system board is designed to meet the ACPI (Advanced Configuration and Power Interface) specification. ACPI has energy saving features that enables PCs to implement Power Management and Plug-and-Play with operating systems that support OS Direct Power Management. Currently, only Windows® 98/2000/ME/XP supports the ACPI function. ACPI when enabled in the Power Management Setup will allow you to use the Suspend to RAM function.

With the Suspend to RAM function enabled, you can power-off the system at once by pressing the power button or selecting “Standby” when you shut down Windows® 98/2000/ME/XP without having to go through the sometimes tiresome process of closing files, applications and operating system. This is because the system is capable of storing all programs and data files during the entire operating session into RAM (Random Access Memory) when it powers-off. The operating session will resume exactly where you left off the next time you power-on the system.
Important:
The 5VSB power source of your power supply must support ≥1A.

Virus Protection

Most viruses today destroy data stored in hard drives. The system board is designed to protect the boot sector and partition table of your hard disk drive.

Package Checklist

The system board package contains the following items:

- The system board
- A user’s manual
- One IDE cable
- One floppy cable
- One Serial ATA data cable
- One Serial ATA power cable
- One “Main Board Utility” CD
- One I/O shield

If any of these items are missing or damaged, please contact your dealer or sales representative for assistance.
Chapter 2 - Hardware Installation

System Board Layout
Warning:
Electrostatic discharge (ESD) can damage your system board, processor, disk drives, add-in boards, and other components. Perform the upgrade instruction procedures described at an ESD workstation only. If such a station is not available, you can provide some ESD protection by wearing an antistatic wrist strap and attaching it to a metal part of the system chassis. If a wrist strap is unavailable, establish and maintain contact with the system chassis throughout any procedures requiring ESD protection.

System Memory

The system board supports DDR SDRAM DIMM. Double Data Rate SDRAM (DDR SDRAM) is a type of SDRAM that doubles the data rate through reading and writing at both the rising and falling edge of each clock. This effectively doubles the speed of operation therefore doubling the speed of data transfer.

BIOS Setting
Configure the system memory in the Advanced Chipset Features submenu of the BIOS.
Installing the DIM Module

A DIM module simply snaps into a DIMM socket on the system board. Pin 1 of the DIM module must correspond with Pin 1 of the socket.

1. Pull the “tabs” which are at the ends of the socket to the side.
2. Position the DIMM above the socket with the “notch” in the module aligned with the “key” on the socket.
3. Seat the module vertically into the socket. Make sure it is completely seated. The tabs will hold the DIMM in place.
CPU

Overview

The system board is equipped with a surface mount mPGA479M (Socket 479) CPU socket. This socket is exclusively designed for installing an Intel® Pentium® M / Celeron® M processor.

Installing the CPU

1. Make sure the PC and all other peripheral devices connected to it has been powered down.

2. Disconnect all power cords and cables.

3. Locate the 479-pin CPU socket on the system board.

4. Use a screwdriver to turn the screw to its unlock position.
5. Position the CPU above the socket. The gold triangular mark on
the CPU must align with pin 1 of the CPU socket.

**Important:**
*Handle the CPU by its edges and avoid touching the pins.*

6. Insert the CPU into the socket until it is seated in place. The
CPU will fit in only one orientation and can easily be inserted
without exerting any force. Use a screwdriver to turn the screw
to its lock position.

**Important:**
*Do not force the CPU into the socket. Forcing the CPU into
the socket may bend the pins and damage the CPU.*
Installing the Fan and Heat Sink

The CPU must be kept cool by using a CPU fan with heat sink. Without sufficient air circulation across the CPU and heat sink, the CPU will overheat damaging both the CPU and system board.

Note:

- Use only the fan and heat sink assembly included in the system board package.
- The fan and heat sink package contains the fan and heat sink assembly, and a retension module base.

1. Match and insert the screw holes of the retention module base to the mounting holes around the CPU socket from the bottom through the top of the system board.
2. Place the heat sink on top of the CPU. The 4 screws around the heat sink must match the screw holes of the retention module base. Refer to the figure below for the correct position of the heat sink. This is important so that the fan / heat sink will provide adequate cooling to the components of the system board.

Turn each Phillips head screw half way down first to initially stabilize the heat sink onto the system board, then finally tighten each screw.

**Important:**

*Do not turn the first screw all the way down followed by the next and so on. This is to avoid imbalance which might cause cracks or fractures to the CPU and/or heat sink assembly.*
Jumper Settings

Clear CMOS Data

If you encounter the following,

a) CMOS data becomes corrupted.

b) You forgot the supervisor or user password.

you can reconfigure the system with the default values stored in the ROM BIOS.

To load the default values stored in the ROM BIOS, please follow the steps below.

1. Power-off the system and unplug the power cord.

2. Set JP9 pins 2 and 3 to On. Wait for a few seconds and set JP9 back to its default setting, pins 1 and 2 On.

3. Now plug the power cord and power-on the system.
JP1 is used to select the power of the PS/2 keyboard/mouse port. Selecting 5VSB will allow you to use the PS/2 keyboard or PS/2 mouse to wake up the system.

**BIOS Setting**

Configure the PS/2 keyboard/mouse wake up function in the Integrated Peripherals submenu (“Super IO Device” section) of the BIOS. Refer to chapter 3 for more information.

**Important:**

The 5VSB power source of your power supply must support $\geq 720\text{mA}$. 
USB Power Select

JP2 and JP5 are used to select the power of the USB ports. Selecting 5VSB will allow you to use the USB keyboard or USB mouse to wake up the system.

**BIOS Setting**

“USB KB Wake-Up From S3” in the Power Management Setup submenu of the BIOS must be set to Enabled. Refer to chapter 3 for more information.

**Important:**

- If you are using the Wake-On-USB Keyboard/Mouse function for 2 USB ports, the 5VSB power source of your power supply must support ≥1.5A. For 3 or more USB ports, the 5VSB power source of your power supply must support ≥2A.
JP3 is used to select the power supplied to the LCD panel and to configure the inverter.

**Important:**

Before powering-on the system, make sure JP3’s setting matches the LCD panel’s specification. Selecting the incorrect voltage will seriously damage the LCD panel.
Use J4 to connect to the LCD Brightness Control button of the LCD Display Panel. It is used to adjust the brightness of the LCD Display Panel. Increasing or decreasing the voltage to control the LCD panel's brightness varies among Inverters. You must refer to the Inverter’s specification to make the appropriate adjustment to the brightness of the LCD panel.
JP6 is used to set COM 4 to RS-232 or RS-485. If the serial device connected to this port requires 5V/12V power from the system board, set JP6 pins 1-3, 2-4, 9-11 and 10-12 to On. This setting automatically sets COM 4 at RS-232.

<table>
<thead>
<tr>
<th>COM 4 RS232/RS485/AUX Select</th>
<th>JP6</th>
</tr>
</thead>
<tbody>
<tr>
<td>RS232 (default)</td>
<td>1-3, 2-4, 7-9, 8-10 On</td>
</tr>
<tr>
<td>RS485</td>
<td>3-5, 4-6, 7-9, 8-10 On</td>
</tr>
<tr>
<td>Auxiliary power</td>
<td>1-3, 2-4, 9-11 (12V), 10-12 (5V) On</td>
</tr>
</tbody>
</table>
COM 2 is an RS-232 port. If the serial device connected to this port requires 5V/12V power from the system board, set JP4 pins 3-5 and 4-6 to On. Otherwise, leave this jumper’s setting at 1-3, 2-4 On.
JP8 is used to select the method of powering on the system. If you want the system to power-on whenever AC power comes in, set JP8 pins 1 and 2 to On. If you want to use the power button, set pins 2 and 3 to On.

**Important:**

If you want the system to automatically power-on when power returns after an AC power failure, you must:

1. Set JP8 pins 1 and 2 to On.
2. The PWRON After PWR-Fail field must be set to "On". (Integrated Peripherals submenu, Super I/O Device section of the BIOS).
Pentium M Processor FSB Select

JP7 is used to select the front side bus of a Pentium® M processor.

**Important:**
Overclocking may result to the CPU’s or system’s instability and are not guaranteed to provide better system performance. If you are unable to boot your system due to overclocking, make sure to set this jumper back to its default settings.
Hardware Installation

Rear Panel I/O Ports

The rear panel I/O ports consist of the following:

- PS/2 mouse port
- PS/2 keyboard port
- Parallel port
- COM 1 port
- VGA port
- I394_1 port
- LAN port
- USB ports
- Mic-in jack
- Line-in jack
- Line-out jack
PS/2 Mouse and PS/2 Keyboard Ports

The system board is equipped with an onboard PS/2 mouse (Green) and PS/2 keyboard (Purple) ports - both at location CN1 of the system board. The PS/2 mouse port uses IRQ12. If a mouse is not connected to this port, the system will reserve IRQ12 for other expansion cards.

**Warning:** Make sure to turn off your computer prior to connecting or disconnecting a mouse or keyboard. Failure to do so may damage the system board.

**Wake-On-PS/2 Keyboard/Mouse**

The Wake-On-PS/2 Keyboard/Mouse function allows you to use the PS/2 keyboard or PS/2 mouse to power-on the system. To use this function:

- **Jumper Setting:**
  JP1 must be set to “2-3 On: 5VSB”. Refer to “PS/2 Power Select” in this chapter for more information.
Hardware Installation

- BIOS Setting:
  Configure the PS/2 wake up function in the Integrated Peripherals submenu (‘‘Super IO Device’’ section) of the BIOS. Refer to chapter 3 for more information.

Important:

The 5VSB power source of your power supply must support ≥720mA.
Serial Ports

The system board is equipped with an onboard serial port at location CN4 (COM 1). It is also equipped with three 9-pin connectors at locations J8 (COM 2), J11 (COM 3) and J12 (COM 4). These serial ports are RS-232 and/or RS-485 (COM 4 only) asynchronous communication ports with 16C550A-compatible UARTs that can be used with modems, serial printers, remote display terminals, and other serial devices.

To connect COM 2, COM 3 and/or COM 4, please refer to the following description. The serial ports may be mounted on a card-edge bracket. Install the card-edge bracket to the system chassis then insert the cable connector to J8, J11 or J12. Make sure the colored stripe on the ribbon cable is aligned with pin 1 of J8, J11 or J12.

**Important:**

If the LCD Display Panel that is connected to the LVDS LCD Panel connector supports touch screen, DO NOT connect a serial device to COM 3 because the touch screen function is internally connected to COM 3.
Hardware Installation

Jumper Setting

If the serial device connected to COM 2 and/or COM 4 requires auxiliary power from the system board, set JP4 and/or JP6 appropriately. Refer to “COM 2 RS232/AUX Select” and “COM 4 RS232/RS485/AUX Select” in this chapter for more information.

BIOS Setting

Configure the serial ports in the Integrated Peripherals submenu of the BIOS. Refer to chapter 3 for more information.
Parallel Port

The system board has a standard parallel port (Burgundy) at location CN7 for interfacing your PC to a parallel printer. It supports SPP, ECP and EPP.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>SPP (Standard Parallel Port)</td>
<td>Allows normal speed operation but in one direction only.</td>
</tr>
<tr>
<td>ECP (Extended Capabilities Port)</td>
<td>Allows parallel port to operate in bidirectional mode and at a speed faster than the SPP’s data transfer rate.</td>
</tr>
<tr>
<td>EPP (Enhanced Parallel Port)</td>
<td>Allows bidirectional parallel port operation at maximum speed.</td>
</tr>
</tbody>
</table>

**BIOS Setting**

Select the parallel port’s mode in the Integrated Peripherals submenu (“Super IO Device” section) of the BIOS. Refer to chapter 3 for more information.
The system board can only be used with an analog video monitor. Connect the monitor’s 15-pin D-shell cable connector to the VGA port (Blue) at location CN2. If your monitor supports analog video but does not have a 15-pin D-shell connector, see your monitor dealer for the adapter or optional cable. After you plug the monitor cable into the VGA port, gently tighten the cable screws to hold the connector in place. Some monitors have a switch that chooses between analog and TTL (or digital) operation. If your monitor has such a switch, set it for analog.

**BIOS Setting**

Configure the onboard VGA in the Advanced Chipset Features submenu of the BIOS.

**Driver Installation**

Install the “Intel Graphics Drivers”. Refer to chapter 4 for more information.
The system board is equipped with an onboard IEEE 1394 port at location CN6 (IEEE 1394_1) of the system board.

It is also equipped with an IEEE 1394 connector at location J5 (IEEE 1394_2) for connecting an additional 1394 device. The 1394 port may come mounted on a card-edge bracket. Install the card-edge bracket to the system chassis then insert the connector that is attached to the 1394 port cable to J5. Make sure pin 1 of the cable connector is aligned with pin 1 of the J5. You can now connect an IEEE 1394 device to the port.
Hardware Installation

RJ45 Fast-Ethernet Port

The system board is equipped with an onboard RJ45 LAN port at location CN5. This port allows the system board to connect to a local area network by means of a network hub.

BIOS Setting

Enable or disable the onboard LAN in the Integrated Peripherals submenu (“Onboard Device” section) of the BIOS. Refer to chapter 3 for more information.

Driver Installation

Install the “LAN Drivers”. Refer to chapter 4 for more information.
The system board supports 8 USB 2.0/1.1 ports. USB allows data exchange between your computer and a wide range of simultaneously accessible external Plug and Play peripherals.

The 4 onboard USB 2.0/1.1 ports (Black) are at locations CN5 (USB 3-4) and CN6 (USB 1-2).

J13 (USB 5-6) and J14 (USB 7-8) allow you to connect 4 additional USB 2.0/1.1 ports. The USB ports may be mounted on a card-edge bracket. Install the card-edge bracket to the system chassis then insert the connector that is attached to the USB port cables to J13 or J14.

**BIOS Setting**

Configure the onboard USB in the Integrated Peripherals submenu (“Onboard Device” section) of the BIOS. Refer to chapter 3 for more information.
Driver Installation

You may need to install the proper drivers in your operating system to use the USB device. Refer to your operating system’s manual or documentation for more information.

If you are using a USB 2.0 device, install the “Intel USB 2.0 Drivers”. Refer to chapter 4 for more information.

Wake-On-USB Keyboard/Mouse

The Wake-On-USB Keyboard/Mouse function allows you to use a USB keyboard or USB mouse to wake up a system from the S3 (STR - Suspend To RAM) state. To use this function:

- **Jumper Setting:**
  JP2 and/or JP5 must be set to “2-3 On: 5VSB”. Refer to “USB Power Select” in this chapter for more information.

- **BIOS Setting:**
  “USB KB Wake-Up From S3” in the Power Management Setup submenu of the BIOS must be set to Enabled. Refer to chapter 3 for more information.

**Important:**
If you are using the Wake-On-USB Keyboard/Mouse function for 2 USB ports, the 5VSB power source of your power supply must support $\geq$1.5A. For 3 or more USB ports, the 5VSB power source of your power supply must support $\geq$2A.
Audio (Rear Audio and Front Audio)

Rear Audio

The system board is equipped with 3 audio jacks at location CN3. A jack is a one-hole connecting interface for inserting a plug.

- **Mic-in (Pink)**
  In a 2-channel or 4-channel mode, this jack is used to connect an external microphone. In a 6-channel mode, this jack functions as Center/Subwoofer.

- **Line-in (Light Blue)**
  In a 2-channel mode, this jack is used to connect any audio devices such as Hi-fi set, CD player, tape player, AM/FM radio tuner, synthesizer, etc. In a 4-channel or 6-channel mode, this jack functions as rear right/left speaker out.

- **Line-out (Lime)**
  In a 2-channel mode, this jack is used to connect a headphone or external speakers. In a 4-channel or 6-channel mode, this jack functions as front right/left speaker out.
Hardware Installation

<table>
<thead>
<tr>
<th></th>
<th>2-channel</th>
<th>4-channel</th>
<th>6-channel</th>

<td>Front R/L</td>
</tr>
<tr>
<td>Pink</td>
<td>Mic-in</td>
<td>Mic-in</td>
<td>Center/Subwoofer</td>
</tr>
</tbody>
</table>

Front Audio

The front audio connector (J1) allows you to connect to the line-out and mic-in jacks that are at the front panel of your system. Using the line-out and mic-in jacks will disable the rear audio’s line-out and mic-in functions.

Remove the jumper caps from pins 5-6 and pins 9-10 of J1 prior to connecting the front audio cable connector. Make sure pin 1 of the cable connector is aligned with pin 1 of J1. If you are not using this connector, make sure to replace the jumper caps back to their original pin locations.

- Pins 5-6 and 9-10 short
  (default)  The front audio is disabled.
  The rear audio is enabled.

- Pins 5-6 and 9-10 open  The front audio is enabled.
  The rear audio is disabled.

Driver Installation

Install the “Audio Drivers”. Refer to chapter 4 for more information.
I/O Connectors

CD-in Internal Audio Connector

The CD-in connector at location J3 is used to receive audio from a CD-ROM drive, TV tuner or MPEG card.
The S/PDIF connector is used to connect external S/PDIF ports. Your S/PDIF ports may be mounted on a card-edge bracket. Install the card-edge bracket to the system chassis then connect the audio cable connector to SPDIF1. Make sure pin 1 of the audio cable connector is aligned with pin 1 of SPDIF1.
LVDS LCD Panel, LCD/Inverter Power and LCD AUX Power Connectors

The system board allows you to connect a LCD Display Panel by means of the LVDS LCD panel connector (J7) and the LCD/Inverter power connector (J6). These connectors transmit video signals and power from the system board to the LCD Display Panel. The LCD AUX power connector (J23) is used to connect auxiliary power to the LCD panel. Refer to the next page for the pin functions of these connectors.

Jumper Settings

Refer to the “Jumper Settings” section in this chapter for settings relevant to the LCD panel.
# Hardware Installation

Floppy Disk Drive Connector

The system board is equipped with a shrouded floppy disk drive connector for connecting standard floppy disk drives. To prevent improper floppy cable installation, the shrouded floppy disk header has a keying mechanism. The 34-pin connector on the floppy cable can be placed into the header only if pin 1 of the connector is aligned with pin 1 of the header.

Connecting the Floppy Disk Drive Cable

Install one end of the floppy disk drive cable into the shrouded floppy disk header (J20) on the system board and the other end-most connector to the drive you want to designate as Drive A. If you are connecting another drive (Drive B), install the middle connector of the cable to the drive. The colored edge of the daisy chained ribbon cable should be aligned with pin 1 of J20.

BIOS Setting

Enable or disable this function in the Integrated Peripherals submenu (“Super IO Device” field) of the BIOS. Refer to chapter 3 for more information.
Hardware Installation

Serial ATA Connectors

The system board is equipped with two Serial ATA connectors for connecting Serial ATA devices. Connect one end of the Serial ATA cable to SATA 1 or SATA 2 and the other end to your Serial ATA device.

BIOS Setting

Configure the onboard Serial ATA in the Integrated Peripherals submenu (“OnChip IDE Device” section) of the BIOS. Refer to chapter 3 for more information.
IDE Disk Drive Connectors

The system board is equipped with a shrouded PCI IDE header that will interface two Enhanced IDE (Integrated Drive Electronics) disk drives. To prevent improper IDE cable installation, the shrouded PCI IDE header has a keying mechanism. The 40-pin connector on the IDE cable can be placed into the header only if pin 1 of the connector is aligned with pin 1 of the header.

The IDE connector supports 2 devices, a Master and a Slave. Use an IDE ribbon cable to connect the drives to the system board. An IDE ribbon cable have 3 connectors on them, one that plugs into an IDE connector on the system board and the other 2 connects to IDE devices. The connector at the end of the cable is for the Master drive and the connector in the middle of the cable is for the Slave drive.

Connecting the IDE Disk Drive Cable

Install one end of the IDE cable into the IDE header on the system board and the other connectors to the IDE devices.
Hardware Installation

Adding a Second IDE Disk Drive

When using two IDE drives, one must be set as the master and the other as the slave. Follow the instructions provided by the drive manufacturer for setting the jumpers and/or switches on the drives.

The system board supports Enhanced IDE or ATA-2, ATA/33, ATA/66 and ATA/100 hard drives. We recommend that you use hard drives from the same manufacturer. In a few cases, drives from two different manufacturers will not function properly when used together. The problem lies in the hard drives, not the system board.

**Important:**

If you encountered problems while using an ATAPI CD-ROM drive that is set in Master mode, please set the CD-ROM drive to Slave mode. Some ATAPI CD-ROMs may not be recognized and cannot be used if incorrectly set in Master mode.

**BIOS Setting**

Configure the onboard IDE in the Integrated Peripherals submenu (“OnChip IDE Device” section) of the BIOS. Refer to chapter 3 for more information.
IrDA Connector

Connect your IrDA cable to connector J10 on the system board.

**Note:**
The sequence of the pin functions on some IrDA cable may be reversed from the pin function defined on the system board. Make sure to connect the cable to the IrDA connector according to their pin functions.

**BIOS Setting**

Configure the onboard IrDA in the Integrated Peripherals submenu of the BIOS to the type of IrDA standard supported by your device.

**Driver Installation**

You may need to install the proper drivers in your operating system to use the IrDA function. Refer to your operating system’s manual or documentation for more information.
Connect the CPU fan’s cable connector to the CPU fan connector (J15) on the system board. The 2nd fan (J21) and chassis fan (J22) connectors are used to connect additional cooling fans. The cooling fans will provide adequate airflow throughout the chassis to prevent overheating the CPU and system board components.

**BIOS Setting**

The “PC Health Status” submenu of the BIOS will display the current speed of the cooling fans. Refer to chapter 3 for more information.
The system board supports the chassis intrusion detection function. Connect the chassis intrusion sensor cable from the chassis to the chassis open connector. Whenever a chassis component has been removed, the sensor sends signal to the connector alerting you of a chassis intrusion event.

**Hardware Monitor for Windows**

Install the “Hardware Monitor for Windows” utility. By default, the chassis intrusion detection function is disabled. When enabled, a warning message will appear when the chassis is open. The utility can also be configured so that a beeping alarm will sound when the chassis is open. Refer to the “Hardware Monitor for Windows” section in chapter 4 for more information.
Use a power supply that complies with the ATX12V Power Supply Design Guide Version 1.1. An ATX12V power supply has a standard 20-pin ATX main power connector that must be inserted onto the J19 connector.

The system board requires a minimum of 150 Watt power supply to operate. Your system configuration (amount of memory, add-in cards, peripherals, etc.) may exceed the minimum power requirement. To ensure that adequate power is provided, use a 250 Watt (or greater) power supply.
DIMM and PCI Standby Power LEDs

DIMM Standby Power LED

This LED will turn red when the system's power is on or when it is in the Suspend state (Power On Suspend or Suspend to RAM). It will not light when the system is in the Soft-Off state.

PCI Standby Power LED

This LED will turn red when the system is in the power-on, Soft-Off or Suspend (Power On Suspend or Suspend to RAM) state.

**Important:**

If the DIMM Standby Power LED or PCI Standby Power LED is lighted, you must power-off the system then turn off the power supply’s switch or unplug the power cord prior to installing any memory modules or add-in cards.
Hardware Installation

Front Panel Connectors

HDD-LED - HDD LED
This LED will light when the hard drive is being accessed.

RESET SW - Reset Switch
This switch allows you to reboot without having to power off the system.

PWR-BTN - Power Switch
This switch is used to power on or off the system.

PWR-LED - Power/Standby LED
When the system’s power is on, this LED will light. When the system is in the S1 (POS - Power On Suspend) state, it will blink every second. When the system is in the S3 (STR - Suspend To RAM) state, it will blink every 4 seconds.

- **Key**: 12

Diagram of the Front Panel Connectors
Hardware Installation

PCI Express x16 and x1 Slots

The system board is equipped with one PCI Express x16 and one PCI Express x1 slots.

**PCI Express x16**
Install PCI Express x16 graphics card, that comply to the PCI Express specifications, into the PCI Express x16 slot. To install a graphics card into the x16 slot, align the graphics card above the slot then press it down firmly until it is completely seated in the slot. The retaining clip will automatically hold the graphics card in place.

**PCI Express x1**
Install PCI Express x1 card such as network cards or other cards that comply to the PCI Express specifications into the PCI Express x1 slot.
Chapter 3 - BIOS Setup

Award BIOS Setup Utility

The Basic Input/Output System (BIOS) is a program that takes care of the basic level of communication between the processor and peripherals. In addition, the BIOS also contains codes for various advanced features found in this system board. This chapter explains the Setup Utility for the Award BIOS.

After you power up the system, the BIOS message appears on the screen and the memory count begins. After the memory test, the following message will appear on the screen:

Press DEL to enter setup

If the message disappears before you respond, restart the system or press the “Reset” button. You may also restart the system by pressing the <Ctrl> <Alt> and <Del> keys simultaneously.

When you press <Del>, the main menu screen will appear:

<table>

Time, Date, Hard Disk Type...
Standard CMOS Features

Use the arrow keys to highlight “Standard CMOS Features” and press <Enter>. A screen similar to the one below will appear:

The settings on the screen are for reference only. Your version may not be identical to this one.

Date

The date format is <day>, <month>, <date>, <year>. Day displays a day, from Sunday to Saturday. Month displays the month, from January to December. Date displays the date, from 1 to 31. Year displays the year, from 1990 to 2098.

Time

The time format is <hour>, <minute>, <second>. The time is based on the 24-hour military-time clock. For example, 1 p.m. is 13:00:00. Hour displays hours from 00 to 23. Minute displays minutes from 00 to 59. Second displays seconds from 00 to 59.
IDE Channel 0 Master/Slave and IDE Channel 1 Master/Slave

Move the cursor to the “IDE Channel 0 Master”, “IDE Channel 0 Slave”, “IDE Channel 1 Master” or “IDE Channel 1 Slave” field, then press <Enter>.

The settings on the screen are for reference only. Your version may not be identical to this one.

IDE HDD Auto Detection

Detects the parameters of the drive. The parameters will automatically be shown on the screen.

IDE Channel 0 Master/Slave and IDE Channel 1 Master/Slave

The drive type information should be included in the documentation from your hard disk vendor. If you select "Auto", the BIOS will auto-detect the HDD & CD-ROM drive at the POST stage and show the IDE for the HDD & CD-ROM drive. If a hard disk has not been installed, select “None”.
Access Mode

For hard drives larger than 528MB, you would typically select the LBA type. Certain operating systems require that you select CHS or Large. Please check your operating system's manual or Help desk on which one to select.

Capacity

Displays the approximate capacity of the disk drive. Usually the size is slightly greater than the size of a formatted disk given by a disk checking program.

Cylinder

This field displays the number of cylinders.

Head

This field displays the number of read/write heads.

Precomp

This field displays the number of cylinders at which to change the write timing.

Landing Zone

This field displays the number of cylinders specified as the landing zone for the read/write heads.

Sector

This field displays the number sectors per track.

Drive A and Drive B

These fields identify the types of floppy disk drives installed.

<table>
<thead>
<tr>
<th>Type</th>
<th>Drive Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>

<tr>
<td>2.88M, 3.5 in.</td>
<td>3-1/2 in.</td>
<td>Double-sided drive; 2.88MB capacity</td>
</tr>
</tbody>
</table>
Video

This field selects the type of video adapter used for the primary system monitor. Although secondary monitors are supported, you do not have to select the type. The default setting is EGA/VGA.

- **EGA/VGA**: Enhanced Graphics Adapter/Video Graphics Array. For EGA, VGA, SVGA and PGA monitor adapters.
- **CGA 40**: Color Graphics Adapter. Power up in 40-column mode.
- **CGA 80**: Color Graphics Adapter. Power up in 80-column mode.
- **Mono**: Monochrome adapter. Includes high resolution monochrome adapters.

Halt On

This field determines whether the system will stop if an error is detected during power up. The default setting is All Errors.

- **No Errors**: The system boot will not stop for any errors detected.
- **All Errors**: The system boot will stop whenever the BIOS detects a non-fatal error.
- **All, But Keyboard**: The system boot will not stop for a keyboard error; it will stop for all other errors.
- **All, But Diskette**: The system boot will not stop for a disk error; it will stop for all other errors.
- **All, But Disk/Key**: The system boot will not stop for a disk or keyboard error; it will stop for all other errors.

Base Memory

Displays the amount of base (or conventional) memory installed in the system. The value of the base memory is typically 512K for systems with 512K memory installed on the motherboard or 640K for systems with 640K or more memory installed on the motherboard.
Extended Memory

Displays the amount of extended memory detected during boot-up.

Total Memory

Displays the total memory available in the system.
BIOS Setup

Advanced BIOS Features

The Advanced BIOS Features allows you to configure your system for basic operation. Some entries are defaults required by the system board, while others, if enabled, will improve the performance of your system or let you set some features according to your preference.

The screen above list all the fields available in the Advanced BIOS Features submenu, for ease of reference in this manual. In the actual CMOS setup, you have to use the scroll bar to view the fields. The settings on the screen are for reference only. Your version may not be identical to this one.
CPU Feature

Move the cursor to this field and press <Enter>. The following screen will appear.

The settings on the screen are for reference only. Your version may not be identical to this one.

**Delay Prior To Thermal**

This field is used to select the time that would force the CPU to a 50% duty cycle when it exceeds its maximum operating temperature therefore protecting the CPU and the system board from overheating to ensure a safe computing environment.

**Thermal Management**

Select a “thermal monitor” in this field to enable the CPU’s speedstep function. Restart the system then go to the operating system’s “Control Panel”. Double-click “Power Options”. The “Power Options Properties” dialog box will appear. In the “Power Schemes” menu, select “Portable/Laptop”. Speedstep reduces the CPU’s frequency and voltage in accordance to its load.

- **Thermal Monitor 1** On die throttling.
- **Thermal Monitor 2** Ratio and VID transition.

**TM2 Bus Ratio**

This field is used to select the frequency (bus ratio) of the throttled performance state that will be initiated when the on-die sensor turns from cool to hot.
BIOS Setup

**TM2 Bus VID**

This field is used to select the voltage of the throttled performance state that will be initiated when the on-die sensor turns from cool to hot.

**Execute Disable Bit**

When this field is set to Disabled, it will force the XD feature flag to always return to 0.

**Hard Disk Boot Priority**

This field is used to select the boot sequence of the hard drives. Move the cursor to this field then press <Enter>. Use the Up or Down arrow keys to select a device then press <+> to move it up or <-> to move it down the list.

The settings on the screen are for reference only. Your version may not be identical to this one.
BIOS Setup

CPU L1 & L2 Cache

These fields speed up the memory access. The default value is enabled. Enable the external cache for better performance.

CPU L3 Cache

This field is used to enable or disable the CPU’s L3 cache.

Quick Power On Self Test

This field speeds up Power On Self Test (POST) whenever the system is powered on. The BIOS will shorten or skip some check items during POST. To attain the shortest POST time, select “Fast”.

First Boot Device, Second Boot Device, Third Boot Device and Boot Other Device

Select the drive to boot first, second and third in the “First Boot Device” “Second Boot Device” and “Third Boot Device” fields respectively. The BIOS will boot the operating system according to the sequence of the drive selected. Set “Boot Other Device” to Enabled if you wish to boot from another device.

Swap Floppy Drive

When this field is enabled and the system is booting from the floppy drive, the system will boot from drive B instead of drive A. When this field is disabled and the system is booting from the floppy drive, the system will boot from drive A. You must have two floppy drives to use this function.

Boot Up Floppy Seek

When enabled, the BIOS will check whether the floppy disk drive installed is 40 or 80 tracks. Note that the BIOS cannot distinguish between 720K, 1.2M, 1.44M and 2.88M drive types as they are all 80 tracks. When disabled, the BIOS will not search for the type of floppy disk drive by track number. Note that there will not be any warning message if the drive installed is 360KB.
Boot Up NumLock Status

This allows you to determine the default state of the numeric keypad. By default, the system boots up with NumLock on wherein the function of the numeric keypad is the number keys. When set to Off, the function of the numeric keypad is the arrow keys.

Gate A20 Option

This entry allows you to select how gate A20 is handled. Gate A20 is a device used to address memory above 1 Mbyte. Initially, gate A20 was handled via the keyboard controller. Today, while keyboards still provide this support, it is more common, and much faster, for the system chipset to provide support for gate A20.

- **Fast** The chipset controls Gate A20.
- **Normal** A pin in the keyboard controller controls Gate A20.

Typematic Rate Setting

- **Disabled** Continually holding down a key on your keyboard will cause the BIOS to report that the key is down.
- **Enabled** The BIOS will not only report that the key is down, but will first wait for a moment, and, if the key is still down, it will begin to report that the key has been depressed repeatedly. For example, you would use such a feature to accelerate cursor movements with the arrow keys. You can then select the typematic rate and typematic delay in the “Typematic Rate (Chars/Sec)” and “Typematic Delay (Msec)” fields below.

Typematic Rate (Chars/Sec)

This field allows you to select the rate at which the keys are accelerated.

Typematic Delay (Msec)

This field allows you to select the delay between when the key was first depressed and when the acceleration begins.
Security Option

This field determines when the system will prompt for the password - everytime the system boots or only when you enter the BIOS setup. Set the password in the Set Supervisor/User Password submenu.

- **System**: The system will not boot and access to Setup will be denied unless the correct password is entered at the prompt.
- **Setup**: The system will boot, but access to Setup will be denied unless the correct password is entered at the prompt.

APIC Mode

Leave this field in its default setting.

MPS Version Control for OS

This field is used to select the MPS version that the system board is using.

OS Select for DRAM > 64MB

This field allows you to access the memory that is over 64MB in OS/2.

Report No FDD For WIN 95

The options are Yes and No.

Small Logo (EPA) Show

- **Enabled**: The EPA logo will appear during system boot-up.
- **Disabled**: The EPA logo will not appear during system boot-up.
This section gives you functions to configure the system based on the specific features of the chipset. The chipset manages bus speeds and access to system memory resources. **These items should not be altered unless necessary.** The default settings have been chosen because they provide the best operating conditions for your system. The only time you might consider making any changes would be if you discovered some incompatibility or that data was being lost while using your system.

**DRAM Timing Selectable**

This field is used to select the timing of the DRAM.

- **By SPD**
  The EEPROM on a DIMM has SPD (Serial Presence Detect) data structure that stores information about the module such as the memory type, memory size, memory speed, etc. When this option is selected, the system will run according to the information in the EEPROM. This option is the default setting because it provides the most stable condition for the system. The “CAS Latency Time” to “System Memory Frequency” fields will show the default settings by SPD.

- **Manual**
  If you want better performance for your system other than the one “by SPD”, select “Manual” then...
select the best option in the “CAS Latency Time” to “System Memory Frequency” fields.

CAS Latency Time

This field is used to select the latency between the DRAM read command and the time that the data was received.

DRAM RAS# to CAS# Delay

This field is used to select the latency between the DRAM active command and the read/write command.

DRAM RAS# Precharge

This field is used to select the idle clocks after issuing a precharge command to the DRAM.

Precharge Delay (tRAS)

The options are Auto, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14 and 15.

System Memory Frequency

This field is used to select the memory clock speed of the DIMM.

SLP_S4# Assertion Width

The options are 1 to 2 Sec., 2 to 3 Sec., 3 to 4 Sec. and 4 to 5 Sec.

System BIOS Cacheable

When this field is enabled, accesses to the system BIOS ROM addressed at F000H-FFFFFH are cached, provided that the cache controller is enabled. The larger the range of the Cache RAM, the higher the efficiency of the system.

Video BIOS Cacheable

As with caching the system BIOS, enabling the Video BIOS cache will allow access to video BIOS addressed at C0000H to C7FFFH to be cached, if the cache controller is also enabled. The larger the range of the Cache RAM, the faster the video performance.
Memory Hole At 15M-16M

In order to improve system performance, certain space in memory can be reserved for ISA cards. This memory must be mapped into the memory space below 16MB. When enabled, the CPU assumes the 15-16MB memory range is allocated to the hidden ISA address range instead of the actual system DRAM. When disabled, the CPU assumes the 15-16MB address range actually contains DRAM memory. If more than 16MB of system memory is installed, this field must be disabled to provide contiguous system memory.

PCI Express Root Port Func

Move the cursor to this field and press <Enter>. The following screen will appear:

![Image of BIOS Setup screen]

The settings on the screen are for reference only. Your version may not be identical to this one.

PCI Express Port 1

This field is used to enable or disable the PCI Express port function.

PCI-E Compliancy Mode

This field is used to select the mode for the PCI Express add-in card.
PEG/Onchip VGA Control

This field is used to select the graphics controller that will serve as the primary boot device. The options are Auto, Onchip VGA and PEG Port.

PEG Force X1

The options are Enabled and Disabled.

On-Chip Frame Buffer Size

This field is used to select the onboard VGA’s frame buffer size that is shared from the system memory.

DVMT Mode

This field shows the current DVMT mode.

DVMT/Fixed Memory Size

This field is used to select the graphics memory size used by DVMT/Fixed mode.

Boot Display

This field is used to select the type of display to use when the system boots.

Auto The system will automatically detect the display that is available when the system boots.

CRT Select this option if you want the system to boot the CRT display.

LFP Select this option if you want the system to boot the LFP display.
Panel Number

Panel 1  640x480, one channel 18-bit, LVDS
Panel 2  800x600, one channel 18-bit, LVDS
Panel 3  1024x768, one channel 18-bit, LVDS
Panel 4  1280x1024, two channel 36-bit, LVDS

If you are using one of the standard panels shown above, select the appropriate option according to the type of panel that you are using. Otherwise, please contact your dealer or sales representative for a custom-made BIOS that will suit the panel that you are using.
Integrated Peripherals

The settings on the screen are for reference only. Your version may not be identical to this one.

OnChip IDE Device

Move the cursor to this field and press <Enter>. The following screen will appear:

The settings on the screen are for reference only. Your version may not be identical to this one.
IDE HDD Block Mode

*Enabled* The IDE HDD uses the block mode. The system BIOS will check the hard disk drive for the maximum block size the system can transfer. The block size will depend on the type of hard disk drive.

*Disabled* The IDE HDD uses the standard mode.

IDE DMA Transfer Access

This field, when Enabled, will enhance the IDE DMA transfer of an IDE hard disk drive.

On-Chip Primary PCI IDE

These fields allow you to enable or disable the primary and secondary IDE controller. Select Disabled if you want to add a different hard drive controller.

IDE Primary Master PIO and IDE Primary Slave PIO

PIO means Programmed Input/Output. Rather than have the BIOS issue a series of commands to effect a transfer to or from the disk drive, PIO allows the BIOS to tell the controller what it wants and then let the controller and the CPU perform the complete task by themselves. Your system supports five modes, 0 (default) to 4, which primarily differ in timing. When Auto is selected, the BIOS will select the best available mode after checking your drive.

*Auto* The BIOS will automatically set the system according to your hard disk drive’s timing.

*Mode 0-4* You can select a mode that matches your hard disk drive’s timing. Caution: Do not use the wrong setting or you will have drive errors.

IDE Primary Master UDMA and IDE Primary Slave UDMA

These fields allow you to set the Ultra DMA in use. When Auto is selected, the BIOS will select the best available option after checking your hard drive or CD-ROM.

*Auto* The BIOS will automatically detect the settings for you.

*Disabled* The BIOS will not detect these categories.
**On-Chip Serial ATA Setting**

**On-Chip Serial ATA**

*Disabled* Disables the onboard SATA.

*Auto* The system will detect the existing SATA and IDE drives then automatically set them to the available master/slave mode.

*Combined Mode* This option allows you to use both IDE and SATA drives; allowing a maximum of 4 drives - 1 IDE Master, 1 IDE Slave and 2 SATA; supporting maximum of 2 drives on each channel.

*Enhanced Mode* This option allows you to use both IDE and SATA drives; allowing a maximum of 4 drives - 1 IDE Master, 1 IDE Slave and 2 SATA.

*SATA Only* This option automatically sets the SATA drives to Primary Master mode. Since the SATA drives are in Master mode, you cannot set the IDE drive to Master mode.

**PATA IDE Mode**

This field is used to select the function mode of the IDE connector.

*Primary* IDE serves as Primary Master and Primary Slave channel. SATA 1 and SATA 2 serve as Secondary Master and Secondary Slave channel.

*Secondary* IDE serves as Secondary Master and Secondary Slave channel. SATA 1 and SATA 2 serve as Primary Master and Primary Slave channel.
BIOS Setup

Onboard Device

Move the cursor to this field and press <Enter>. The following screen will appear.

The settings on the screen are for reference only. Your version may not be identical to this one.

USB Controller

*Enabled* Enables the onboard USB.

*Disabled* Disables the onboard USB.

USB 2.0 Controller

If you are using a USB 2.0 device, this field must be set to Enabled.

USB Keyboard Support

By default, this field is Disabled. However, if you are using a USB keyboard under DOS, make sure to enable this function.
**USB Mouse Support**

This field is used to enable or disable the USB mouse.

**AC97 Audio**

- *Auto*  Select this option when using the onboard audio CODEC.
- *Disabled*  Select this option when using a PCI sound card.

**Onboard LAN Control**

This field is used to enable or disable the onboard LAN.
BIOS Setup

Super IO Device

Move the cursor to this field and press <Enter>. The following screen will appear.

The settings on the screen are for reference only. Your version may not be identical to this one.

Power On Function

This field allows you to use the keyboard or PS/2 mouse to power-on the system.

- **Button only**
  Default setting. Uses the power button to power-on the system.

- **Password**
  When this option is selected, set the password you would like to use to power-on the system in the "KB Power On Password" field.

- **Hot Key**
  When this option is selected, select the function key you would like to use to power-on the system in the "Hot Key Power On" field.

- **Mouse Left**
  When this option is selected, double-click the left button of the mouse to power-on the system.

- **Mouse Right**
  When this option is selected, double-click the right button of the mouse to power-on the system.

- **Any Key**
  Press any key to power-on the system.

- **Keyboard 98**
  When this option is selected, press the “wake up” key of the Windows® 98 compatible keyboard to power-on the system.
KB Power On Password

Move the cursor to this field and press <Enter>. Enter your password. You can enter up to 5 characters. Type in exactly the same password to confirm, then press <Enter>.

The power button will not function once a keyboard password has been set in this field. You must type the correct password to power-on the system. If you forgot the password, power-off the system and remove the battery. Wait for a few seconds and install it back before powering-on the system.

Hot Key Power On

This field is used to select a function key that you would like to use to power-on the system.

Onboard FDC Controller

- **Enabled** Enables the onboard floppy disk controller.
- **Disabled** Disables the onboard floppy disk controller.

Onboard Parallel Port

- **378/IRQ7, 3BC/IRQ7, 278/IRQ5** Selects the I/O address and IRQ for the onboard parallel port.
- **Disabled** Disables the onboard parallel port.

Parallel Port Mode

The options are SPP, EPP, ECP and ECP+EPP. These apply to a standard specification and will depend on the type and speed of your device. Refer to your peripheral’s manual for the best option.

- **SPP**
  Allows normal speed operation but in one direction only.

- **“ECP (Extended Capabilities Port)”**
  Allows parallel port to operate in bidirectional mode and at a speed faster than the normal mode’s data transfer rate.

- **“EPP (Enhanced Parallel Port)”**
  Allows bidirectional parallel port operation at maximum speed.
EPP Mode Select

This field is used to select the EPP mode.

ECP Mode Use DMA

This is used to select a DMA channel of the parallel port.

PWRON After PWR-Fail

- **Off**: When power returns after an AC power failure, the system’s power is off. You must press the Power button to power-on the system.
- **On**: When power returns after an AC power failure, the system will automatically power-on.
- **Former-Sts**: When power returns after an AC power failure, the system will return to the state where you left off before power failure occurs. If the system’s power is off when AC power failure occurs, it will remain off when power returns. If the system’s power is on when AC power failure occurs, the system will power-on when power returns.

Serial Port 1 Mode

COM 1 functions as a serial port or IrDA. You cannot use both at the same time.

- **Normal**: This option sets COM 1 as serial port.
- **IrDA**: This option sets COM 1 as IrDA.

Onboard Serial Port 1 and Onboard Serial Port 2

- **Auto**: The system will automatically select an I/O address for the onboard serial port 1 and serial port 2.
- **3F8/IRQ4, 2F8/IRQ3, 3E8/IRQ4, 2E8/IRQ3**: Allows you to manually select an I/O address for the onboard serial port 1 and serial port 2.
- **Disabled**: Disables the onboard serial port 1 and/or serial port 2.
Onboard Serial Port 3

This is used to select an I/O address for the onboard serial port 3. However, if the LCD Display Panel supports touch screen, leave this field in its default setting because the touch screen is internally connected to COM 3 therefore a default address has already been assigned to this port. Make sure COM 3 is not attached with a serial device.

Onboard Serial Port 4

This is used to select an I/O address for the onboard serial port 4.

Serial Port 1 Use IRQ, Serial Port 2 Use IRQ, Serial Port 3 Use IRQ and Serial Port 4 Use IRQ

These fields are used to select an IRQ for the onboard serial port 1, 2, 3 or 4.
The Power Management Setup allows you to configure your system to most effectively save energy.

<table>
<thead>
<tr>
<th>ACPI Function</th>
<th>Enabled</th>
<th>Item Help</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACPI Suspend Type</td>
<td>$1(POS)$</td>
<td>Menu Level</td>
</tr>
<tr>
<td>S1(POS)</td>
<td>Enables the Power On Suspend function.</td>
<td></td>
</tr>
<tr>
<td>S3(STR)</td>
<td>Enables the Suspend to RAM function.</td>
<td></td>
</tr>
</tbody>
</table>

ACPI Function

This function should be enabled only in operating systems that support ACPI. Currently, only Windows® 2000/ME/XP supports this function. If you want to use the Suspend to RAM function, make sure this field is enabled then select “$3(STR)$” in the “ACPI Suspend Type” field.

ACPI Suspend Type

This field is used to select the type of Suspend mode.

$1(POS)$ Enables the Power On Suspend function.

$3(STR)$ Enables the Suspend to RAM function.

Run VGABIOS if S3 Resume

When this field is set to Auto, the system will initialize the VGA BIOS when it wakes up from the S3 state. This can be configured only if the “ACPI Suspend Type” field is set to “$3(STR)$”.

The settings on the screen are for reference only. Your version may not be identical to this one.
Power Management

This field allows you to select the type (or degree) of power saving by changing the length of idle time that elapses before the Suspend mode and HDD Power Down fields are activated.

- **Min Saving**: Minimum power saving time for the Suspend Mode (1 hour) and HDD Power Down (15 min.)
- **Max Saving**: Maximum power saving time for the Suspend Mode and HDD Power Down = 1 min.
- **User Define**: Allows you to set the power saving time in the "Suspend Mode" and "HDD Power Down" fields.

Video Off Method

This determines the manner in which the monitor is blanked.

- **V/H SYNC + Blank**: This selection will cause the system to turn off the vertical and horizontal synchronization ports and write blanks to the video buffer.
- **Blank Screen**: This option only writes blanks to the video buffer.
- **DPMS**: Initializes display power management signaling. Use this option if your video board supports it.

Video Off In Suspend

This field is used to activate the video off feature when the system enters the Suspend mode. The options are Yes and No.

Suspend Type

The options are Stop Grant and PwrOn Suspend.

MODEM Use IRQ

This field is used to set an IRQ channel for the modem installed in your system.
BIOS Setup

Suspend Mode

This is selectable only when the Power Management field is set to User Define. When the system enters the Suspend mode according to the power saving time selected, the CPU and onboard peripherals will be shut off.

HDD Power Down

This is selectable only when the Power Management field is set to User Define. When the system enters the HDD Power Down mode according to the power saving time selected, the hard disk drive will be powered down while all other devices remain active.

Soft-Off by PWR-BTTN

This field allows you to select the method of powering off your system.

*Delay 4 Sec.* Regardless of whether the Power Management function is enabled or disabled, if the power button is pushed and released in less than 4 sec, the system enters the Suspend mode. The purpose of this function is to prevent the system from powering off in case you accidentally “hit” or pushed the power button. Push and release again in less than 4 sec to restore. Pushing the power button for more than 4 seconds will power off the system.

*Instant-Off* Pressing and then releasing the power button at once will immediately power off your system.

CPU THRM-Throttling

Thermal throttling regulates the thermal environment by alternating between running the processor at full speed and placing the processor in a sleep state whenever the upper limits of the thermal envelop are reached.
Wake-Up By PCI Card

**Enabled**  This field should be set to Enabled only if your PCI card such as LAN card or modem card uses the PCI PME (Power Management Event) signal to remotely wake up the system. Access to the LAN card or PCI card will cause the system to wake up. Refer to the card’s documentation for more information.

**Disabled**  The system will not wake up despite access to the PCI card.

Power On By Ring

Set this field to Enabled to use the modem ring-on function. This will allow your system to power-on to respond to calls coming from an external modem.

USB KB Wake-Up From S3

This field, when enabled, allows you to use a USB keyboard to wake up a system that is in the S3 (STR - Suspend To RAM) state. This can be configured only if the “ACPI Suspend Type” field is set to “S3(STR)”.

Resume By Alarm

**Enabled**  When Enabled, you can set the date and time you would like the Soft Power Down (Soft-Off) PC to power-on in the “Date (of Month) Alarm” and “Time (hh:mm:ss) Alarm” fields. However, if the system is being accessed by incoming calls or the network (Resume On Ring/LAN) prior to the date and time set in these fields, the system will give priority to the incoming calls or network.

**Disabled**  Disables the automatic power-on function. (default)

Date (of Month) Alarm

0  The system will power-on everyday according to the time set in the “Time (hh:mm:ss) Alarm” field.

1-31  Select a date you would like the system to power-on. The system will power-on on the set date, and time set in the “Time (hh:mm:ss) Alarm” field.
Time (hh:mm:ss) Alarm

This is used to set the time you would like the system to power-on. If you want the system to power-on everyday as set in the “Date (of Month) Alarm” field, the time set in this field must be later than the time of the RTC set in the Standard CMOS Features submenu.
PnP/PCI Configurations

This section describes configuring the PCI bus system. It covers some very technical items and it is strongly recommended that only experienced users should make any changes to the default settings.

Init Display First

This field is used to select whether to initialize the onboard VGA, PCI Express or PCI first when the system boots.

- **Onboard**: When the system boots, it will first initialize the onboard VGA.
- **PCIEx**: When the system boots, it will first initialize the PCI Express x16 graphics card.
- **PCI Slot**: When the system boots, it will first initialize PCI.

Reset Configuration Data

- **Enabled**: The BIOS will reset the Extended System Configuration Data (ESCD) once automatically. It will then recreate a new set of configuration data.
- **Disabled**: The BIOS will not reset the configuration data.

The settings on the screen are for reference only. Your version may not be identical to this one.
**Resources Controlled By**

The Award Plug and Play BIOS has the capability to automatically configure all of the boot and Plug and Play compatible devices.

**Auto** The system will automatically detect the settings for you.

**Manual** Choose the specific IRQ in the “IRQ Resources” field respectively.

**IRQ Resources**

Move the cursor to this field and press <Enter>. This field is used to set each system interrupt to either Reserved or PCI Device.

The settings on the screen are for reference only. Your version may not be identical to this one.

**PCI/VGA Palette Snoop**

This field determines whether the MPEG ISA/VESA VGA cards can work with PCI/VGA or not. The default value is Disabled.

**Enabled** MPEG ISA/VESA VGA cards work with PCI/VGA.

**Disabled** MPEG ISA/VESA VGA cards does not work with PCI/VGA.

**Maximum Payload Size**

This field is used to select the maximum TLP payload size of the PCI Express devices. The unit is byte.
PC Health Status

Current System Temp., Current CPU Temperature, Current Chassis Fan Speed, Current CPU Fan Speed and Current 2nd Fan Speed

These fields will show the internal temperature of the system, current temperature of the CPU, and the current fan speed of the cooling fans in RPM (Revolutions Per Minute).

CPU(V)

This field shows the detected voltage of the processor:

+1.5V, +3.3V, +5V, +12V, -12V, VBAT(V) and 5VSB(V)

These fields show the output voltage of the power supply.

Note:
The onboard hardware monitor function is capable of detecting “system health” conditions but if you want a warning message to pop-up or a warning alarm to sound when an abnormal condition occurs, you must install the Hardware Monitor for Windows utility. This utility is included in the CD that came with the system board. Refer to the Hardware Monitor for Windows section in chapter 4 for more information.

The settings on the screen are for reference only. Your version may not be identical to this one.
**BIOS Setup**

**Frequency/Voltage Control**

The settings on the screen are for reference only. Your version may not be identical to this one.

**Auto Detect PCI Clk**

When enabled, the system will automatically send clock signals to existing PCI devices.

**Spread Spectrum**

Leave this field in its default setting. Do not alter this setting unless advised by an engineer or technician.
Load Fail-Safe Defaults

The “Load Fail-Safe Defaults” option loads the troubleshooting default values permanently stored in the ROM chips. These settings are not optimal and turn off all high performance features. You should use these values only if you have hardware problems. Highlight this option in the main menu and press <Enter>.

If you want to proceed, type <Y> and press <Enter>. The default settings will be loaded.
Load Optimized Defaults

The “Load Optimized Defaults” option loads optimized settings from the BIOS ROM. Use the default values as standard values for your system. Highlight this option in the main menu and press <Enter>.

Type <Y> and press <Enter> to load the Setup default values.
Set Supervisor Password

If you want to protect your system and setup from unauthorized entry, set a supervisor’s password with the “System” option selected in the Advanced BIOS Features. If you want to protect access to setup only, but not your system, set a supervisor’s password with the “Setup” option selected in the Advanced BIOS Features. You will not be prompted for a password when you cold boot the system.

Use the arrow keys to highlight “Set Supervisor Password” and press <Enter>.

Type in the password. You are limited to eight characters. When done, the message below will appear:

Confirm Password:

You are asked to verify the password. Type in exactly the same password. If you type in a wrong password, you will be prompted to enter the correct password again. To delete or disable the password function, highlight “Set Supervisor Password” and press <Enter>, instead of typing in a new password. Press the <Esc> key to return to the main menu.
Set User Password

If you want another user to have access only to your system but not to setup, set a user’s password with the “System” option selected in the Advanced BIOS Features. If you want a user to enter a password when trying to access setup, set a user’s password with the “Setup” option selected in the Advanced BIOS Features.

Using user’s password to enter Setup allows a user to access only “Set User Password” that appears in the main menu screen. Access to all other options is denied.

Use the arrow keys to highlight “Set User Password” and press <Enter>.

Type in the password. You are limited to eight characters. When done, the message below will appear:

Confirm Password:

You are asked to verify the password. Type in exactly the same password. If you type in a wrong password, you will be prompted to enter the correct password again. To delete or disable the password function, highlight “Set User Password” and press <Enter>, instead of typing in a new password. Press the <Esc> key to return to the main menu.
Save & Exit Setup

When all the changes have been made, highlight “Save & Exit Setup” and press <Enter>.

Type “Y” and press <Enter>. The modifications you have made will be written into the CMOS memory, and the system will reboot. You will once again see the initial diagnostics on the screen. If you wish to make additional changes to the setup, press <Ctrl> <Alt> <Esc> simultaneously or <Del> after memory testing is done.
Exit Without Saving

When you do not want to save the changes you have made, highlight “Exit Without Saving” and press <Enter>.

Type “Y” and press <Enter>. The system will reboot and you will once again see the initial diagnostics on the screen. If you wish to make any changes to the setup, press <Ctrl> <Alt> <Esc> simultaneously or <Del> after memory testing is done.
To update the BIOS, you will need the new BIOS file and a flash utility, AWDFLASH.EXE. Please contact technical support or your sales representative for the files.

1. Save the new BIOS file along with the flash utility AWDFLASH.EXE to a floppy disk.

2. Reboot the system and enter the Award BIOS Setup Utility to set the first boot drive to “Floppy”.

3. Save the setting and reboot the system.

4. After the system booted from the floppy disk, execute the flash utility by typing AWDFLASH.EXE. The following screen will appear:

5. Type the new BIOS file name onto the gray area that is next to “File Name to Program” then press <Enter>.
6. The following will appear:

   Do You Want to Save BIOS (Y/N)

   This question refers to the current existing BIOS in your system. We recommend that you save the current BIOS and its flash utility; just in case you need to reinstall the BIOS. To save the current BIOS, press <Y> then enter the file name of the current BIOS. Otherwise, press <N>.

7. The following will then appear:

   Press “Y” to Program or “N” to Exit

8. Press <Y> to flash the new BIOS.
Chapter 4 - Supported Software

Drivers, Utilities and Software Applications

The CD that came with the system board contains drivers, utilities and software applications required to enhance the performance of the system board.

Insert the CD into a CD-ROM drive. The autorun screen (Main Board Utility CD) will appear. If after inserting the CD, "Autorun" did not automatically start (which is, the Mainboard Utility CD screen did not appear), please go directly to the root directory of the CD and double-click "Setup".
Supported Software

Intel Chipset Software Installation Utility

The Intel Chipset Software Installation Utility is used for updating Windows® INF files so that the Intel chipset can be recognized and configured properly in the system.

To install the utility, please follow the steps below.

1. Click “Intel Chipset Software Installation Utility” on the main menu. The following screen will appear:

2. Follow the prompts on the screen to complete installation.

3. Reboot the system for the utility to take effect.
Intel Graphics Drivers

To install the driver, please follow the steps below.

1. Click “Intel Graphics Drivers” on the main menu. The following screen will appear:

![Intel Graphics Media Accelerator Driver](image)

2. Follow the prompts on the screen to complete installation.

3. Reboot the system for the driver to take effect.
Supported Software

Audio Drivers

To install the driver, please follow the steps below.

1. Click “Audio Drivers” on the main menu. The following screen will appear:

![Realtek AC’97 Audio Setup](image)

2. Follow the prompts on the screen to complete installation.

3. Reboot the system for the driver to take effect.
LAN Drivers

To install the driver, please follow the steps below.

1. Click “LAN Drivers” on the main menu. The following screen will appear:

![LAN Drivers Installation Screen](image)

2. Follow the prompts on the screen to complete installation.

3. Reboot the system for the driver to take effect.
Hardware Monitor for Windows

Hardware Monitor for Windows is capable of monitoring the system’s hardware conditions such as the temperature of the CPU and system, voltage, and speed of the cooling fans. It also allows you to manually set a range to the items being monitored. If the values are over or under the set range, a warning message will pop-up. The utility can also be configured so that a beeping alarm will sound whenever an error occurs. We recommend that you use the “Default Setting” which is the ideal setting that would keep the system in good working condition.

To install the utility, please follow the steps below.

1. Click “Hardware Monitor for Windows” on the main menu. The screen below will appear:

   ![InstallShield Wizard](image)

   - Welcome to the InstallShield Wizard for Hardware Doctor
   - The InstallShield Wizard will install Hardware Doctor on your computer. To continue, click Next.

2. Follow the prompts on the screen to complete installation.

3. Restart the system.
Microsoft DirectX 9 Driver

To install, please follow the steps below.

1. Click “Microsoft DirectX 9 Driver” on the main menu. The following screen will appear.

2. Click “I accept the agreement” then click “Next”.

3. Follow the prompts on the screen to complete installation.

4. Reboot the system for the driver to take effect.
Supported Software

Intel USB 2.0 Drivers

The Intel chipset does not support USB 2.0 drivers for Windows® 98 SE and Windows® ME.

Windows® XP

If your Windows® XP CD already includes Service Pack 1, the USB 2.0 driver will automatically install when you install the operating system. If the CD does not include Service Pack 1, it is available for download at Microsoft’s Windows Update website.

Windows® 2000

If your Windows® 2000 CD already includes Service Pack 4, the USB 2.0 driver will automatically install when you install the operating system. If the CD does not include Service Pack 4, it is available for download at Microsoft’s Windows Update website.

Installation Notes

1. "Autorun" ONLY supports the Windows® 98 SE, Windows® ME, Windows® 2000, Windows NT® 4.0 and Windows® XP operating systems. If after inserting the CD, "Autorun" did not automatically start (which is, the Main Board Utility CD screen did not appear), please go directly to the root directory of the CD and double-click "Setup".

2. All steps or procedures to install software drivers are subject to change without notice as the softwares are occasionally updated. Please contact technical support or your sales representative for the latest version of the drivers or software applications.
Appendix A - Watchdog Timer

Watchdog Timer

The following parameters are references for setting the time interval of the Watchdog Timer function. The system will regularly be “cleared” according to the set time interval. If the system hangs or fails to function, it will also reset according to the time interval so that your system will continue to operate.

```
mov dx,04e <Enter>
mov al,87 <Enter>
out dx,al <Enter>
out dx,al <Enter>
mov dx,04e <Enter>
mov al,07 <Enter>
out dx,al <Enter>
inc dx <Enter>
inc al <Enter>
out dx,al <Enter>
dec dx <Enter>
mov al,f6 <Enter>
out dx,al <Enter>
inc dx <Enter>
mov al,xy <Enter>
out dx,al <Enter>
```

“XY” is the Watchdog Time count value for the “00h to “FFh” range wherein the time can be set from 0 sec. to 255 sec.
Appendix B - System Error Message

When the BIOS encounters an error that requires the user to correct something, either a beep code will sound or a message will be displayed in a box in the middle of the screen and the message, PRESS F1 TO CONTINUE or DEL TO ENTER SETUP, will be shown in the information box at the bottom. Enter Setup to correct the error.

POST Beep

There are two kinds of beep codes in the BIOS. One code indicates that a video error has occurred and the BIOS cannot initialize the video screen to display any additional information. This beep code consists of a single long beep followed by three short beeps. The other code indicates that a DRAM error has occurred. This beep code consists of a single long beep.

Error Messages

One or more of the following messages may be displayed if the BIOS detects an error during the POST. This list indicates the error messages for all Awards BIOSes:

CMOS BATTERY HAS FAILED
The CMOS battery is no longer functional. It should be replaced.

Caution:
Danger of explosion if battery incorrectly replaced. Replace only with the same or equivalent type recommended by the manufacturer. Dispose of used batteries according to the battery manufacturer’s instructions.

CMOS CHECKSUM ERROR
Checksum of CMOS is incorrect. This can indicate that CMOS has become corrupt. This error may have been caused by a weak battery. Check the battery and replace if necessary.

DISPLAY SWITCH IS SET INCORRECTLY
The display switch on the motherboard can be set to either monochrome or color. This indicates the switch is set to a different
setting than indicated in Setup. Determine which setting is correct, either turn off the system and change the jumper or enter Setup and change the VIDEO selection.

**Floppy Disk(s) fail (80)**
Unable to reset floppy subsystem.

**Floppy Disk(s) fail (40)**
Floppy type mismatch.

**Hard Disk(s) fail (80)**
HDD reset failed.

**Hard Disk(s) fail (40)**
HDD controller diagnostics failed.

**Hard Disk(s) fail (20)**
HDD initialization error.

**Hard Disk(s) fail (10)**
Unable to recalibrate fixed disk.

**Hard Disk(s) fail (08)**
Sector Verify failed.

**Keyboard is locked out - Unlock the key**
The BIOS detects that the keyboard is locked. Keyboard controller is pulled low.

**Keyboard error or no keyboard present**
Cannot initialize the keyboard. Make sure the keyboard is attached correctly and no keys are being pressed during the boot.

**Manufacturing POST loop**
System will repeat POST procedure infinitely while the keyboard controller is pull low. This is also used for the M/B burn in test at the factory.

**BIOS ROM checksum error - System halted**
The checksum of ROM address F000H-FFFFFH is bad.

**Memory test fail**
The BIOS reports memory test fail if the memory has error(s).
Troubleshooting Checklist

This chapter of the manual is designed to help you with problems that you may encounter with your personal computer. To efficiently troubleshoot your system, treat each problem individually. This is to ensure an accurate diagnosis of the problem in case a problem has multiple causes.

Some of the most common things to check when you encounter problems while using your system are listed below.

1. The power switch of each peripheral device is turned on.
2. All cables and power cords are tightly connected.
3. The electrical outlet to which your peripheral devices are connected is working. Test the outlet by plugging in a lamp or other electrical device.
4. The monitor is turned on.
5. The display's brightness and contrast controls are adjusted properly.
6. All add-in boards in the expansion slots are seated securely.
7. Any add-in board you have installed is designed for your system and is set up correctly.

Monitor/Display

If the display screen remains dark after the system is turned on:

1. Make sure that the monitor's power switch is on.
2. Check that one end of the monitor's power cord is properly attached to the monitor and the other end is plugged into a working AC outlet. If necessary, try another outlet.
3. Check that the video input cable is properly attached to the monitor and the system's display adapter.
4. Adjust the brightness of the display by turning the monitor's brightness control knob.
Troubleshooting

The picture seems to be constantly moving.

1. The monitor has lost its vertical sync. Adjust the monitor's vertical sync.
2. Move away any objects, such as another monitor or fan, that may be creating a magnetic field around the display.
3. Make sure your video card’s output frequencies are supported by this monitor.

The screen seems to be constantly wavering.

1. If the monitor is close to another monitor, the adjacent monitor may need to be turned off. Fluorescent lights adjacent to the monitor may also cause screen wavering.

Power Supply

When the computer is turned on, nothing happens.

1. Check that one end of the AC power cord is plugged into a live outlet and the other end properly plugged into the back of the system.
2. Make sure that the voltage selection switch on the back panel is set for the correct type of voltage you are using.
3. The power cord may have a “short” or “open”. Inspect the cord and install a new one if necessary.

Floppy Drive

The computer cannot access the floppy drive.

1. The floppy diskette may not be formatted. Format the diskette and try again.
2. The diskette may be write-protected. Use a diskette that is not write-protected.
3. You may be writing to the wrong drive. Check the path statement to make sure you are writing to the targeted drive.
4. There is not enough space left on the diskette. Use another diskette with adequate storage space.
Troubleshooting

Hard Drive

Hard disk failure.

1. Make sure the correct drive type for the hard disk drive has been entered in the BIOS.
2. If the system is configured with two hard drives, make sure the bootable (first) hard drive is configured as Master and the second hard drive is configured as Slave. The master hard drive must have an active/bootable partition.

Excessively long formatting period.

1. If your hard drive takes an excessively long period of time to format, it is likely a cable connection problem. However, if your hard drive has a large capacity, it will take a longer time to format.

Parallel Port

The parallel printer doesn’t respond when you try to print.

1. Make sure that your printer is turned on and that the printer is on-line.
2. Make sure your software is configured for the right type of printer attached.
3. Verify that the onboard LPT port’s I/O address and IRQ settings are configured correctly.
4. Verify that the attached device works by attaching it to a parallel port that is working and configured correctly. If it works, the printer can be assumed to be in good condition. If the printer remains inoperative, replace the printer cable and try again.
Serial Port

The serial device (modem, printer) doesn’t output anything or is outputting garbled characters.

1. Make sure that the serial device’s power is turned on and that the device is on-line.
2. Verify that the device is plugged into the correct serial port on the rear of the computer.
3. Verify that the attached serial device works by attaching it to a serial port that is working and configured correctly. If the serial device does not work, either the cable or the serial device has a problem. If the serial device works, the problem may be due to the onboard I/O or the address setting.
4. Make sure the COM settings and I/O address are configured correctly.

Keyboard

Nothing happens when a key on the keyboard was pressed.

1. Make sure the keyboard is properly connected.
2. Make sure there are no objects resting on the keyboard and that no keys are pressed during the booting process.

System Board

1. Make sure the add-in card is seated securely in the expansion slot. If the add-in card is loose, power off the system, re-install the card and power up the system.
2. Check the jumper settings to ensure that the jumpers are properly set.
3. Verify that all memory modules are seated securely into the memory sockets.
4. Make sure the memory modules are in the correct locations.
5. If the board fails to function, place the board on a flat surface and seat all socketed components. Gently press each component into the socket.
6. If you made changes to the BIOS settings, re-enter setup and load the BIOS defaults.
